

# Riparian vegetation along streams in the Tatra Mts, Slovakia

R. ŠOLTÉS and A. CIRIAKOVÁ

Institute of High Mountain Biology, Tatranská Javorina 7, SK-059 56 Slovak Republic, e-mail: rudolf.soltés@uniza.sk; aciriakova@gmail.com

**Abstract.** 103 relevés of riparian vegetation have been submitted to cluster analyses, five vegetation types were distinguished: *Petasites hybridus*, *Rubus idaeus* - *Urtica dioica*, *Senecio nemorensis*, *Luzula sylvatica*-*Dicranum scoparium*, *Ligusticum mutellina*. Every vegetation type is characterized from ecological and floristical viewpoints. Physico-chemical characteristics (Conductivity, pH, dissolved oxygen, redox potential, chemical oxygen demand, calcium carbonate, nitrates, ammonia and chlorides) were plotted as ordination axes (CCA) and some geographical characteristics (bedrock, orientation, chalet presence) were plotted as supplementary environmental variables. Natural or anthropogenic disturbance events result in extra input of nutrients. Some species correlate with environmental variables, e. g. with altitude correlate *Anthoxanthum alpinum*, *Solidago \*minuta*, with  $\text{NO}_3^-$  *Chamaerion angustifolium* and *Petasites hybridus*, with  $\text{NH}_3$  *Urtica dioica*.

**Key words:** riparian vegetation, cluster analysis, water quality, Tatra Mts

## Introduction

For riparian vegetation is characteristic high ecological or species diversity. This is a migration corridor for animals and plants (Timoney *et al.* 1997). Riparian wetland is the major transition zone between aquatic and terrestrial ecosystems and has an important role in water purification (Wang and Wang 2010). Nevertheless, the retention of nitrogen pollution by riparian wetland soil occurs mainly in the top 0-10 cm layer (Zhao 2009).

The study area represents around 90000 hectares and covers parts of two major catchments: Baltic see and Black see. The glacial history of the region has resulted in a complex pattern of glacial relief types like glaciated knobs, morainic basins and others. On November 19, 2004, the Northern down-slope wind (locally named Bora) felled 12,000 ha of forest; about 2.3 million m<sup>3</sup> of wood in the Tatra Mts. Consequently, a large wildfire hit the windfall area at July 31, 2005, and 250 ha was completely burnt. Forest stand disintegration or deforestation may disturb hydrology and ecology.

Riparian vegetation in the Tatra Mts grows in a variety of geomorphic settings ranging from talus cones in Podtatranská kotlina basin to morainic basins in the alpine region. Elimination of riparian vegetation occurs either where high ground-water use lowers the water table below the rooting depth of riparian species or where base flow is completely diverted, or both (Webb and Leak 2006).

The land use or the chemistry of the waters of riparian vegetation was the matter of interest of more researchers. Chemical oxygen demand (COD) gives information on organic contamination - disintegration of animal or plant bodies, leakage of manures.

The term "salinity" refers to the amount of dissolved salts that are present in water. Sodium and chloride are the predominant ions, and the concentrations of magnesium, calcium, and sulfate ions are also substantial. The measure of dissolved ions in the water is conductivity.

Value of redox potential gives informations on oxidative or reducing conditions in the waters. Positive value suggests an oxidative situation in the waters and negative value reducing status. In natural waters oxidative situations are connected with dissolved oxygen, this is the most important dissolved gas and is precondition for life in waters. In running waters predominates oxygen of atmospheric origin and is indicator of water purity.

Ammonium cations may be indicator of faecal contamination or may come from geological background. In combination with increased COD (Chemical oxygen demand), show contamination by animal waste material.

The important nitrates source is decomposition of organic substances in soils, significant nitrates source is atmosphaeric deposition also. Increasing downstream nitrates concentration suggests organic substances input. In mountain conditions, chlorides concentration in running waters depends exclusively in atmosphaeric precipitation, the source is marine aerosols containing sodium chloride.

Hardness in water is defined as concentration of bivalent cations, these cations include Ca<sup>2+</sup> and Mg<sup>2+</sup>. The hardness is often indicated by German degrees (*Deutsche Härte*, °dH or dH), where one degree German is defined as 10 milligrams of calcium oxide per litre of water. This is equivalent to 17.848 milligrams of calcium carbonate per litre of water, or 17.848 ppm.

Total Dissolved Solids (TDS) is a measure of the combined content of all inorganic and organic substances contained in a liquid, in molecular, ionized or micro-granular (colloidal sol) suspended form. Primary sources for TDS are agricultural and residential runoff. The most common chemical

constituents are calcium, phosphates, nitrates, sodium, potassium and chlorides. When submerged, these plants are highly flexible and, therefore, adapt themselves to the flow, they react in a wavy motion to the flow.

White and Greer (2005) investigated the effects of watershed urbanization on streamflow characteristics and the riparian vegetation of Los Penasquitos Creek in Southern California. In 1966 – 2000 urban land uses increased from 9% to 37% of the watershed, over the same time period median and minimum daily discharges increased significantly (White and Greer 2005). For differentiation in the ecosystems, probably the most significant influence is the transport of sediments with nutrients (Barendregt 2003).

Małek and Krakowian (2009) analysed waters in the catchments of two streams (Zimník and Czerna) in the Beskid Śląski. The data set consists of nutrients contents and physicochemical characteristics. Schneider *et al.* (2000) studied indication of trophic status using submerged macrophyte vegetation.

Wang (2010) found that submerged vegetation combined with flow intensity influences the  $\text{NH}_4^+$ -N release. When the water flow is relatively small, the submerged vegetation is quite capable of inhibiting sediment suspension and reducing  $\text{NH}_4^+$ -N release, but when flow reaches a certain value, the presence of aquatic plants exacerbates sediment suspension and promotes  $\text{NH}_4^+$ -N release.

Wondzell *et al.* (2007) developed models to evaluate the effects of natural disturbances and land-use practices on aquatic and riparian habitats, consisting of discrete states defined by channel morphology and riparian vegetation.

## Material and Methods

### Data set

All the 103 relevés were taken following standard procedures of the Zürich-Montpellier School (Braun-Blanquet 1964; Westhoff and Van Den Maarel 1978), using the modified 9-degree Braun-Blanquet's sampling scale (Barkman *et al.* 1964) transformed into the ordinal scale of Van den Maarel (1979) and stored in the TURBOVEG data-base (Hennekens and Schaminée 2001). Shrub- and herb-layer records for any one taxon were merged, the data were exported into JUICE 7.0 software for analysis (Tichý and Holt 2006). Nomenclature of the taxa follows the Checklist by Marhold & Hindák (1998).

### Data analysis

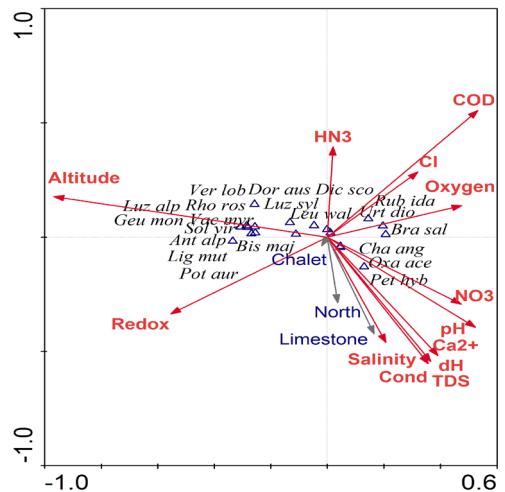

CANOCO 4.5 for Windows package (Ter Braak and Smilauer 2002) was used for all statistical analysis. Since the length of the longest gradient in the log report was  $> 5$ , we used the unimodal methods - CCA (Ter Braak and Smilauer 2002). The statistical significance of the explanatory (environmental) variables in canonical methods were determined by Monte Carlo permutation tests. Explanatory variables were tested separately (partial tests). For ordination analysis we used ordinal species data without transformation. Numerical classification of the 103 relevés was performed using the statistical

tool for plant ecology MULVA-5 (Wildi and Orlóci 1996). For ecological interpretation of the ordination axes, bedrock, orientation and chalet presence was plotted onto CCA ordination diagram as supplementary environmental variables.

### Chemistry

The following parameters were measured by portable devices at sampling sites: Conductivity and salinity using device YSI EC300, pH level using device YSI pH100. Determination of dissolved oxygen is based on fluorescence detection using device YSI DO200. Determination of chlorides, ammonia and nitrates is based on colorimetry using direct-reading photometer YSI 9500, redox potential (ORP) by device YSI ORP 15. Volumetric methods have been used for determination following features-manganometry for chemical oxygen demand (COD) determination and chelatometry for  $\text{CaCO}_3$  determination.

## Results and discussion

**Fig. 1.** Canonical correspondence analysis (CCA), triplot, ordination diagram of selected species and environmental variables. Species list: Urt dio – *Urtica dioica*, Rub ida – *Rubus idaeus*, Cha ang – *Chamaerion angustifolium*, Lig mut – *Ligusticum mutellina*, Ver lob – *Veratrum lobelianum*, Luz alp – *Luzula alpino-pilosa*, Geu mon – *Oreogenum montanum*, Sol vir – *Solidago alpestris*, Pot aur – *Potentilla aurea*, Bis maj – *Bistorta major*, Rho ros – *Rhodiola rosea*, Ant alp – *Anthoxanthum alpinum*, Dor aus – *Doronicum austriacum*, Luz syl – *Luzula sylvatica*, Leu wal – *Leucanthemum waldsteinii*, Vac myr – *Vaccinium myrtillus*, Oxa ace – *Oxalis acetosella*, Pet hyb – *Petasites hybridus*, Bra sal – *Brachythecium salebrosum*, Dic sco – *Dicranum scorpioides*.

The first axes explains 18.3 % of species-environment relation (Eigenvalue 0.642), this axis negatively correlate with altitude ( $r = -0.9206$ ), in a lesser extent the first axis is positively correlated with COD ( $r = 0.5059$ ). The second axis explains 12.2% of species-environment relation (Eigenvalue 0.429), no significant correlations have been found with this axis, only in a lesser extent the second axis is positively correlated with COD ( $r = 0.4781$ ).

Species correlated with altitude are *Potentilla aurea*, *Veratrum \*lobelianum*, *Ligusticum mutellina*, *Anthoxanthum alpinum*, *Solidago \*minuta*, *Rodiola rosea*, *Doronicum austriacaum*, *Vaccinium myrtillus*. With  $\text{NO}_3^-$ , conductivity and pH shifted to neutral zone correlate *Chamaerion angustifolium* and *Petasites hybridus*. Species correlated with  $\text{NH}_3$ , COD, dissolved oxygen and Cl are *Urtica dioica*, *Rubus idaeus*, *Brachythecium salebrosum*.

As for environment variables, positively are highly correlated salinity - conductivity ( $r = 0.942$ ), salinity - TDS ( $r = 0.938$ ), salinity -  $\text{Ca}^{2+}$  ( $r = 0.839$ ), positively are also correlated  $\text{Ca}^{2+}$  - TDS ( $r = 0.918$ ),  $\text{Ca}^{2+}$  - conductivity ( $r = 0.904$ ),  $\text{Ca}^{2+}$  - pH ( $r = 0.830$ ), conductivity - pH ( $r = 0.716$ ). The correlations between  $\text{Ca}^{2+}$  and conductivity or conductivity and pH level are easy to explain. The more calcium cations the higher conductivity and the more basic reaction. Chlorides and nitrates have a partly common origin. In mountain conditions, chlorides concentration in running waters depends exclusively in atmosphaeric precipitation, the source are marine aerosols containing sodium chloride. Significant nitrates source is atmosphaeric deposition as well. Another nitrates source is decomposition of organic substances in soils. Probably this is why the correlation is insignificant ( $r = 0.567$ ). Negative correlation between dissolved oxygen and oxydo-reduction potential ( $r = -0.644$ ) is unexpected and difficult to explain. The value of redox potential gives information on oxidative or reducing conditions in the waters. Positive value suggests an oxidative situation in the waters and negative value reducing status. In natural waters oxidative situations are connected with dissolved oxygen.

Some physico-chemical characteristics are highly significant: Altitude  $p = 0.002$ ; COD  $p = 0.002$ ; pH  $p = 0.002$ ;  $\text{Ca}^{2+}$   $p = 0.002$ ;  $\text{dH} = 0.004$ ; Conductivity  $p = 0.002$ ; TDS  $p = 0.006$ ; Redox potential  $p = 0.002$ ;  $\text{NO}_3^-$   $p = 0.016$ ; Cl  $p = 0.052$ ; Oxygen  $p = 0.006$ ; Salinity  $p = 0.022$ ;  $\text{NH}_3$   $p = 0.104$ .

Corbacho et al. (2003) found that nearly 50% of the natural Mediteranean riparian vegetation of the study area has been highly modified or has disappeared, in most cases replaced by non-natural formations.

Wondzell et al. (2007) found that Euro-American settlement dramatically changed riparian vegetation and channel conditions, which resulted in substantial declines in habitat quality. Impacts of land use and management may strongly influence fire properties and regimes in riparian areas (Dwire and Kauffman 2003).

Huang et al. (2011) searched for mean removal per flood pulse throughout the US Midwest for some nutrients. Mean removal per flood pulse for nitrate-nitrite were  $1.81 \text{ g-N.m}^{-2}$  per pulse.

Limit value of COD is  $3 \text{ mg.l}^{-1}$ . In the Tatra Mts, this value was overstepped in sites with human activities.

The ammonium limit concentration in running waters is  $0.5 \text{ mg NH}_4^+ 1000 \text{ ml}^{-1}$ . This concentration has never been exceeded in streams, usually vary between  $0 - 0.2 \text{ mg NH}_4^+$ , only exceptionally  $0.35 \text{ mg}$ , Velická dolina, 1825 m a.s.l. Because of low value of COD on the site ( $0.61 \text{ mg.l}^{-1}$ ), contamination by animal waste material is excluded. The only explanation is local faecal contamination.

#### Riparian vegetation

The following vegetation types corellating with altitude were created as a result of cluster analysis (Table 1):

- A. Vegetation type *Petasites hybridus*
- B. Vegetation type *Rubus idaeus-Urtica dioica*
- C. Vegetation type *Senecio nemorensis*
- D. Vegetation type *Luzula sylvatica-Dicranum scoparium*
- E. Vegetation type *Ligusticum mutellina*

**Table 1.** Shortened synoptic table of riparian vegetation with percentage frequency and modified fidelity index (phi – Φ – coefficient). The taxa are sorted according to their fidelity (phi coefficient x 100, upper index). A - vegetation type *Petasites hybridus*, B - vegetation type *Rubus idaeus-Urtica dioica*, C - vegetation type *Senecio nemorensis*, D - vegetation type *Luzula sylvatica-Dicranum scoparium*, E - vegetation type *Ligusticum mutellina*. The species occurring in only one column were excluded from the table, as well as the species of  $\Phi < 20$ .

#### A. Vegetation type *Petasites hybridus* (Table 2)

Nitrophilous broad-leaved tall herb communities dominated by *Petasites hybridus* and *Chaerophyllum hirsutum*, occurring at riparian habitats along streams, most often in habitats influenced by man or by cattle. In the Tatra Mts., the community occurs in the altitude 639 – 1252 m a.s.l. Similar community described Jarolímek and Kliment (2004) in the Nízke Tatry Mts (community *Petasites hybridus* within the class *Mulgedio-Aconitetea*) occurring also in the surrounding of abandoned shepherd's shanties. The vegetation type prefers SSE facing, mild inclined slopes, approximately 10°.

High °dH value (3.98) indicates high concentration of bivalent cations which correlates with basic pH (7.81). Decomposition of organic substances in soils is indicated by high concentration of nitrates (1.52 mg.l<sup>-1</sup>) and by high value of COD (1.29 mg.l<sup>-1</sup>). Agricultural and residential runoff is indicated by high TDS value (0.08g.l<sup>-1</sup>). The high measure of dissolved ions in the water induces relatively high conductivity (80.72 µS.cm<sup>-2</sup>/25 °C).

#### Relevé localities:

- Suchá dolina, riparian vegetation, 995 m a.s.l., cover total 80%, E1 80%, E0 40%, relevé area 4.50 m<sup>2</sup>, July 21, 2010, longitude 193625.00, latitude 491246.00, aspect 225°, slope 65°, leg. Ciriaková.
- Bielovodská dolina, riparian vegetation, 1208 m a.s.l., cover total 70%, E2 15%, E1 65%, E0 5%, relevé area 4.50 m<sup>2</sup>, June 27, 2010, longitude 200637.00, latitude 491208.00, aspect 45°, slope 5°, leg. Ciriaková.
- Dolina Bielej vody kežmarskej, riparian vegetation, 1010 m a.s.l., cover total 100%, E2 20%, E1 100%, E0 1%, relevé area 3.00 m<sup>2</sup>, August 24, 2010, longitude 201650.00, latitude 491141.00, aspect 135°, slope 15°, leg. Šoltés.
- Suchá dolina, riparian vegetation, 863 m a.s.l., cover total 70%, E1 55%, E0 60%, relevé area 4.00 m<sup>2</sup>, July 21, 2010, longitude 193630.00, latitude 491253.00, aspect 180°, slope 7°, leg. Ciriaková.
- Kóprová dolina, riparian vegetation, 984 m a.s.l., cover total 95%, E1 65%, E0 60%, relevé area 4.00 m<sup>2</sup>, September 21, 2010, longitude 195526.00, latitude 490911.00, aspect 270°, slope 10°, leg. Ciriaková, Šoltés.

6. Bobrovecká dolina, riparian vegetation, 882 m a.s.l., cover total 75%, E3 30%, E1 60%, E0 20%, relevé area 4.00 m<sup>2</sup>, September 14, 2010, longitude 194518.00, latitude 491646.00, aspect 45°, slope 3°, leg. Ciriaková.

7. Bystrá dolina, riparian vegetation, 862 m a.s.l., cover total 75%, E3 30%, E1 60%, E0 20%, relevé area 3.00 m<sup>2</sup>, August 11, 2010, longitude 195137.00, latitude 490715.00, aspect 180°, slope 45°, leg. Ciriaková.

8. Jalovská dolina, riparian vegetation, 862 m a.s.l., cover total 100%, E1 100%, E0 1%, relevé area 4.00 m<sup>2</sup>, July 23, 2010, longitude 193851.00, latitude 490951.00, aspect 90°, slope 20°, leg. Ciriaková.

9. Liptovské Matiašovce, riparian vegetation, 643 m a.s.l., cover total 100%, E1 100%, E0 3%, relevé area 3.00 m<sup>2</sup>, July 21, 2010, longitude 193301.00, latitude 490933.00, aspect 225°, slope 5°, leg. Ciriaková.

10. Bielovodská dolina, riparian vegetation, 1007 m a.s.l., cover total 80%, E3 35%, E1 75%, E0 3%, relevé area 4.50 m<sup>2</sup>, June 27, 2010, longitude 200604.00, latitude 491435.00, aspect 90°, slope 5°, leg. Ciriaková.

11. Štôla, riparian vegetation, 816 m a.s.l., cover total 90%, E2 5%, E1 90%, E0 50%, relevé area 4.00 m<sup>2</sup>, October 14, 2010, longitude 200833.00, latitude 490501.00, aspect 90°, slope 5°, leg. Ciriaková, Šoltés, Cachovanová.

12. Ždiar-Biela, riparian vegetation, 832 m a.s.l., cover total 90%, E1 80%, E0 50%, relevé area 4.50 m<sup>2</sup>, October 21, 2010, longitude 201732.00, latitude 491558.00, aspect 90°, slope 25°, leg. Ciriaková, Šoltés, Cachovanová.

13. Tat. Javorina-Javorinka, riparian vegetation, 951 m a.s.l., cover total 80%, E1 80%, E0 40%, relevé area 4.50 m<sup>2</sup>, October 21, 2010, longitude 200901.00, latitude 491612.00, aspect 45°, slope 15°, leg. Ciriaková, Šoltés, Cachovanová.

14. Važec, riparian vegetation, 783 m a.s.l., cover total 100%, E1 100%, E0 40%, relevé area 4.00 m<sup>2</sup>, October 14, 2010, longitude 195819.00, latitude 490328.00, aspect 225°, slope 3°, leg. Ciriaková, Šoltés, Cachovanová.

15. Látaná dolina, riparian vegetation, 1075 m a.s.l., cover total 80%, E2 5%, E1 75%, E0 25%, relevé area 4.00 m<sup>2</sup>, September 15, 2010, longitude 194254.00, latitude 491434.00, aspect 270°, slope 10°, leg. Ciriaková.

16. Zverovka, riparian vegetation, 1024 m a.s.l., cover total 100%, E1 100%, E0 5%, relevé area 4.00 m<sup>2</sup>, September 15, 2010, longitude 194228.00, latitude 491444.00, aspect 45°, slope 4°, leg. Ciriaková.

17. Beliansky potok, riparian vegetation, 1295 m a.s.l., cover total 100%, E1 100%, relevé area 3.00 m<sup>2</sup>, July 14, 2010, longitude 195854.00, latitude 490829.00, aspect 270°, slope 15°, leg. Ciriaková.

**Table 2.** Vegetation type *Petasites hybridus*

B. Vegetation type *Rubus idaeus-Urtica dioica*  
(Table 3)

The community is widespread in the altitude 679 – 1252 m a.s.l., usually along felled areas, only exceptionally occurs in higher altitudes, always in man influenced habitats, e. g. vertical exception is the site near Chata pri Zelenom plese (1529 m asl). The sites are dominated by nitrophilous felled area species – *Chamaerion angustifolium*, *Urtica dioica*, *Rubus idaeus*. The group of differential species is finished by bryophyte *Brachythecium salebrosum*. The community occupies mainly rather steep slopes (19° in average) facing SE.

Similar secondary community in the Tatra Mts described Šmarda *et al.* (1963) in Tomanova dolina Valley. Forest floor species, felled area species and nitrophilous species are occurring in the relevés.

Organic contamination brought about high COD value (1.78 mg.l<sup>-1</sup> in average), which correlates with higher NO<sub>3</sub><sup>-</sup> concentration (1.29 mg.l<sup>-1</sup> in average).

Relevé localities:

1. Mengusovská dolina, riparian vegetation, 1195 m a.s.l., cover total 100%, E2 15%, E1 100%, E0 1%, relevé area 3.00 m<sup>2</sup>, August 13, 2010, longitude 200457.00, latitude 490659.00, aspect 90°, slope 25°, leg. Šoltés.
2. Skalnatá dolina, riparian vegetation, 928 m a.s.l., cover total 100%, E2 5%, E1 100%, E0 1%, relevé area 3.00 m<sup>2</sup>, August 16, 2010, longitude 201718.00, latitude 491045.00, aspect 90°, slope 10°, leg. Šoltés.
3. Veľký Šum, riparian vegetation, 1106 m a.s.l., cover total 100%, E2 5%, E1 100%, E0 2%, relevé area 4.50 m<sup>2</sup>, August 3, 2010, longitude 200650.00, latitude 490712.00, aspect 90°, slope 10°, leg. Šoltés.
4. Batizovská dolina, riparian vegetation, 1130 m a.s.l., cover total 100%, E2 2%, E1 100%, E0 2%, relevé area 4.50 m<sup>2</sup>, July 8, 2010, longitude 200824.00, latitude 490726.00, aspect 180°, slope 10°, leg. Šoltés.
5. Kamenistá dolina, riparian vegetation, 910 m a.s.l., cover total 80%, E1 80%, E0 1%, relevé area 4.00 m<sup>2</sup>, August 3, 2010, longitude 195347.00, latitude 490810.00, aspect 180°, slope 5°, leg. Ciriaková.
6. Važecká dolina, riparian vegetation, 1223 m a.s.l., cover total 100%, E2 60%, E1 80%, E0 1%, relevé area 3.00 m<sup>2</sup>, July 13, 2010, longitude 200054.00, latitude 490716.00, aspect 225°, slope 15°, leg. Ciriaková, Šoltés.
7. Slavkovský potok, riparian vegetation, 973 m a.s.l., cover total 100%, E1 100%, E0 1%, relevé area 3.00 m<sup>2</sup>, July 14, 2010, longitude 201208.00, latitude 490745.00, aspect 90°, slope 45°, leg. Šoltés.
8. Stará Lesná, riparian vegetation, 719 m a.s.l., cover total 100%, E1 100%, E0 38%, relevé area 4.00 m<sup>2</sup>, October 13, 2010, longitude 201825.00, latitude 490803.00, aspect 135°, slope 40°, leg. Ciriaková, Šoltés, Cachovanová.
9. Mlynčeky, riparian vegetation, 679 m a.s.l., cover total 90%, E2 5%, E1 50%, E0 50%, relevé area 6.00 m<sup>2</sup>, October 13, 2010, longitude 202258.00, latitude 490959.00, aspect 135°, slope 20°, leg. Ciriaková, Šoltés, Cachovanová.

10. Poprad-letisko, riparian vegetation, 689 m a.s.l., cover total 80%, E2 5%, E1 80%, E0 1%, relevé area 4.00 m<sup>2</sup>, October 13, 2010, longitude 201554.00, latitude 490400.00, aspect 135°, slope 10°, leg. Ciriaková, Šoltés, Cachovanová.
11. Tatranská Lomnica-Eurocamp, riparian vegetation, 736 m a.s.l., cover total 100%, E2 5%, E1 100%, E0 1%, relevé area 4.00 m<sup>2</sup>, October 13, 2010, longitude 201926.00, latitude 490842.00, aspect 180°, slope 10°, leg. Ciriaková, Šoltés, Cachovanová.
12. Batizovce, riparian vegetation, 749 m a.s.l., cover total 100%, E1 100%, E0 1%, relevé area 6.00 m<sup>2</sup>, October 13, 2010, longitude 201115.00, latitude 490425.00, aspect 135°, slope 2°, leg. Ciriaková, Šoltés, Cachovanová.
13. Račkova dolina, riparian vegetation, 791 m a.s.l., cover total 70%, E1 70%, E0 2%, relevé area 4.50 m<sup>2</sup>, October 13, 2010, longitude 194829.00, latitude 490618.00, aspect 135°, slope 15°, leg. Ciriaková, Cachovanová.
14. Velická dolina, riparian vegetation, 990 m a.s.l., cover total 95%, E2 2%, E1 95%, E0 2%, relevé area 4.00 m<sup>2</sup>, October 14, 2010, longitude 201028.00, latitude 490716.00, aspect 135°, slope 5°, leg. Ciriaková, Šoltés, Cachovanová.
15. Tatranská Štrba, riparian vegetation, 859 m a.s.l., cover total 90%, E1 85%, E0 25%, relevé area 4.00 m<sup>2</sup>, October 14, 2010, longitude 200436.00, latitude 490422.00, aspect 180°, slope 10°, leg. Ciriaková, Šoltés, Cachovanová.
16. Dolina Zeleného potoka, riparian vegetation, 1534 m a.s.l., cover total 90%, E2 3%, E1 90%, E0 1%, relevé area 3.00 m<sup>2</sup>, June 28, 2010, longitude 201326.00, latitude 491239.00, aspect 135°, slope 5°, leg. Ciriaková.
17. Veľký Šum, riparian vegetation, 1191 m a.s.l., cover total 80%, E1 80%, E0 2%, relevé area 3.00 m<sup>2</sup>, July 9, 2010, longitude 200627.00, latitude 490732.00, aspect 90°, slope 3°, leg. Ciriaková.
18. Belanský potok, riparian vegetation, 1092 m a.s.l., cover total 85%, E3 20%, E2 20%, E1 65%, E0 2%, relevé area 2.00 m<sup>2</sup>, July 14, 2010, longitude 195755.00, latitude 490821.00, aspect 225°, slope 65°, leg. Ciriaková.
19. Studená dolina, riparian vegetation, 928 m a.s.l., cover total 70%, E2 25%, E1 70%, E0 5%, relevé area 6.00 m<sup>2</sup>, October 14, 2010, longitude 201540.00, latitude 490906.00, aspect 135°, slope 20°, leg. Ciriaková, Šoltés, Cachovanová.
20. Bielovodská dolina, riparian vegetation, 953 m a.s.l., cover total 80%, E1 80%, E0 5%, relevé area 4.50 m<sup>2</sup>, October 21, 2010, longitude 200703.00, latitude 491455.00, aspect 45°, slope 30°, leg. Ciriaková, Šoltés, Cachovanová.
21. Kôprová dolina, riparian vegetation, 1495 m a.s.l., cover total 90%, E1 80%, E0 15%, relevé area 3.00 m<sup>2</sup>, September 21, 2010, longitude 200000.00, latitude 491138.00, aspect 135°, slope 2°, leg. Ciriaková, Šoltés.
22. Slavkovská dolina, riparian vegetation, 1252 m a.s.l., cover total 75%, E1 75%, E0 2%, relevé area 3.00 m<sup>2</sup>, July 2, 2010, longitude 201103.00, latitude 490831.00, aspect 135°, slope 60°, leg. Ciriaková.

**Table 3.** Vegetation type *Rubus idaeus-Urtica dioica***C. Vegetation type *Senecio nemorensis* (Table 4)**

This vegetation type occurs in the vertical span 676 – 1497 m a.s.l., stands are without distinct differential species, relatively higher constancy shows *Senecio nemorensis*. Vegetation type prefers mild inclined (12° in average), SSW facing slopes. Decomposition of organic substances in soils is indicated by rather high NO<sub>3</sub><sup>-</sup> concentration (1.25 mg.l<sup>-1</sup> in average).

**Table 4.** Vegetation type *Senecio nemorensis*

*D. Vegetation type Luzula sylvatica-Dicranum scoparium* (Table 5)

This vegetation type is widespread in the altitude 901–1664 m a.s.l., usually occupies SSE facing and mild inclined slopes (9.8° in average).

Large group of differential species is created by *Oxalis acetosella*, *Luzula sylvatica*, *Doronicum austriacum*, *Leucanthemum rotundifolium*, *Vaccinium myrtillus* and moss *Dicranum scoparium*. Unusual large participation constitute bryophytes in the floristic composition (32%).

Low value of TDS (0.02 g.l<sup>-1</sup>) indicates lack of agricultural and residential runoff, which answers low nitrate concentration (1.06 mg.l<sup>-1</sup> in average) and low value of COD (1.20 mg.l<sup>-1</sup> in average).

*Relevé localities:*

1. Kamenistá dolina, riparian vegetation, 1273 m a.s.l., cover total 75%, E3 30%, E2 5%, E1 60%, E0 30%, relevé area 4.00 m<sup>2</sup>, August 3, 2010, longitude 195235.00, latitude 491009.00, aspect 135°, slope 15°, leg. Ciriaková.
2. Mlynická dolina, riparian vegetation, 1338 m a.s.l., cover total 70%, E1 35%, E0 60%, relevé area 2.00 m<sup>2</sup>, July 12, 2010, longitude 200402.00, latitude 490706.00, aspect 180°, slope 5°, leg. Ciriaková, Šoltés.

**Table 5.** Vegetation type *Luzula sylvatica-Dicranum scoparium*

E. Vegetation type *Ligusticum mutellina* (Table 6)

This vegetation type occupies headwater sites in the altitude 1344 – 1947 m a.s.l, predominantly mild inclined (8° in average), SSE facing slopes. From phytocoenological viewpoint, these sites are evaluated within the class *Mulgedio-Aconitetea*, mainly within the alliance *Trisetion fusci*. Group of differential species is large, consists of *Ligusticum mutellina*, *Veratrum \* lobelianum*, *Luzula alpino-pilososa*, *Oreogenum montanum*, *Solidago \* minuta*, *Potentilla aurea*, *Polygonum bistorta*, *Rodiola rosea*.

The low TDS (0.01 g.l⁻¹ in average), low COD (0.92 mg.l⁻¹ in average) and low nitrate concentration (0.85 mg.l⁻¹ in average) suggest that the water is similar to rain water in chemistry.

Relevé localities:

1. Tristárska dolina, riparian vegetation, 1346 m a.s.l, cover total 60%, E1 5%, E1 60%, E0 5%, relevé area 4.50 m<sup>2</sup>, June 24, 2010, longitude 201236.00, latitude 491517.00, aspect 90°, slope 5°, leg. Ciriaková.
2. Važecká dolina, riparian vegetation, 1836 m a.s.l, cover total 90%, E1 90%, E0 1%, relevé area 3.00 m<sup>2</sup>, July 13, 2010, longitude 200014.00, latitude 490906.00, aspect 180°, slope 8°, leg. Ciriaková.
3. Batizovská dolina, riparian vegetation, 1893 m a.s.l, cover total 45%, E1 45%, E0 2%, relevé area 3.00 m<sup>2</sup>, July 8, 2010, longitude 200756.00, latitude 490906.00, aspect 225°, slope 15°, leg. Ciriaková.
4. Mlynická dolina, riparian vegetation, 1892 m a.s.l, cover total 65%, E1 65%, E0 2%, relevé area 3.00 m<sup>2</sup>, July 12, 2010, longitude 200231.00, latitude 490936.00, aspect 235°, slope 5°, leg. Ciriaková, Šoltés.

## Summary

103 relevés have been taken in periodically overflooded riparian zones, along streams of the Tatra Mts in the altitude 639 – 1947 m a.s.l. The relevés were stored in the database system TURBOVEG, exported into JUICE 7.0 for cluster analysis. The following vegetation types were distinguished: *Petasites hybridus*, *Rubus idaeus* – *Urtica dioica*, *Senecio nemorensis*, *Luzula sylvatica*-*Dicranum scoparium*, *Ligusticum mutellina*. The vegetation types *Petasites hybridus*, *Rubus idaeus*-*Urtica dioica* are nitrophilous, occurring most often in habitats in lower parts of the territory influenced by man or by cattle. Vegetation type in the vertical span 676-1497 m a.s.l., is without distinct differential species, relatively higher constancy shows *Senecio nemorensis*. Decomposition of organic substances in soils is indicated by rather high NO<sub>3</sub><sup>-</sup> concentration. Vegetation type *Luzula sylvatica*-*Dicranum scoparium* is widespread in the altitude 901-1664 m a.s.l., large group of differential species is created by forest floor species, large proportion in the floristic composition show bryophytes. Vegetation type *Ligusticum mutellina* occupies headwater sites.

## Acknowledgement

The fieldwork was supported by the Norwegian Financial Mechanisms, project Sk 0061.
