

***Fissidens osmundoides* Hedw. (Bryophyta) in Slovakia**

R. ŠOLTÉS

Institute of High Mountain Biology, Tatranská Javorina 7, SK-059 56 Slovak Republic, e-mail: rudolf.soltés@uniza.sk

Abstract. The paper presents current knowledge on ecology and distribution of the bryophyte species *Fissidens osmundoides* in Slovakia. Phytocoenological variation of the species has been processed. Threat status using new criteria was re-assessed.

Key words: Bryophytes, *Fissidens osmundoides*, ecology, distribution, phytocoenology, threat status, Slovakia.

Introduction

Synonyms:

Conomitrium osmundooides (HEDW.) MÜLL. HAL.
Dicranum bryoides SW.
Dicranum bryoides var. *elongatum* HOOK & TAYL.
Dicranum osmundooides (HEDW.) TUTNER.
Dicranum palmatum var. *osmundooides* (HEDW.) AM.
Dicranum viridulum var. *osmundooides* (HEDW.) DUBY
Fissidens bryoides var. *osmundooides* (HEDW.) MATHIEU
Fissidens dicarpor BRID.
Hypnum aspleniooides DICKS.
Osmundula fissidentoides RABENH.
Schistiphyllum osmundooides (HEDW.) LINDB.
Skitophyllum osmundooides (HEDW.) BACH. PYL

The moss species *Fissidens osmundooides* Hedw. is a member of the *Fissidentaceae* family with a sub-arctic-subalpine distribution (Düll 1994). *Fissidens osmundooides* is found growing on damp rock crevices and in flushes. The species is easily recognized by its unbordered, relatively short and wide leaves, wide cells and purple seta. Smith (1978) reported its distribution as Europe, the Faroe Islands, Iceland, Siberia, Central Asia, Japan, Malaya, North America, Greenland and southern South America. In Slovakia, the moss found its optimum habitat in the alpine zone of the Tatra Mts. The oldest known record of the species is in the Slovak National Museum in Bratislava, where an item collected in 1921 is stored: "Fissidens osmundooides (Sw.) Hedw., Europa centralis, Tatra magna, prope lacum Batizovské, dense caespitosa ad rupes humosas, 1800m, leg. et det. J. Podpěra, VII 1921, rev. Valent. Pospišil 1972, est". Dickson (1973) recorded findings of sub-fossils of *Fissidens osmundooides* in the counties of Caernarvon, Cumberland and Westerness.

Methods

Sampling

Data on distribution of *Fissidens osmundooides* in Slovakia were obtained from the available literature, searching different herbaria and by our own research in the field. The relevés were taken following standard procedures of the Zürich-Montpellier School (Braun-Blanquet 1964; Westhoff and Van der Maarel 1978), using the modified 9-degree Braun-Blanquet's sampling scale (Barkman *et al.* 1964) transformed into the ordinal scale of Van der Maarel (1979) and stored in the TURBOVEG database (Hennekens and Schaminée 2001). Shrub- and herb-layer records for any one taxon were merged; data were exported into JUICE 7.0 software for analysis (Tichý and Holt 2006). Geographic coordinates were recorded in the WGS 84 system using a Garmin e-Trex Vista device or were taken from Google Earth geographic information.

Nomenclature

Nomenclature of vascular plants follows the Checklist by Marhold (1998), that of the syntaxa the list of Mucina and Maglocký (1985). Nomenclature of bryophytes follows Kučera *et al.* (2012) or, for those not included in this list, Hill *et al.* (2006).

Threat categories

Threat status has been re-assessed using criteria suggested by Hallingbäck *et al.* (1998) and tested on Swedish bryophytes Hallingbäck (1998).

Instrumental analysis

Aqueous aluminium was determined spectrophotometrically using pyrocatechin violet (Driscoll 1984) and ammonium nitrate using a spectrophotometric method with Nessler reagent (Horáková *et al.* 1989). Chlorides, sulphates and nitrates were determined using capillary zonal electrophoresis, EA 101 device, with a buffer solution of 7 mM succinic acid + 0.5 mM BTP (bis-tris-propen) + 5% PVP (polyvinylpyrrolidine) + 0.1 % MHEC (methyl-hydroxyethylcelulose). Cations (K^+ , Na^+ , Ca^{2+} , Mg^{2+}) were determined using isotachophoretic methods in the first colony, ZKI 02 device. The following electrolytes were used:

LE: 10 mmol.l⁻¹ NH₄OH + CH₃COOH + 30% PEG (polyethylene glycol) + 0.1% HEC (hydroxyethylcelulose).

TE: 8 mmol.l⁻¹ tetraethylammonium perchlorate. Conductivity was determined using OK-104 device, pH by pH-meter WTW pH 91.

Herbaria coding

Shortcuts of herbaria follow INDEX HERBARIORUM, Missouri Botanical Garden, U.S.A. Missouri, Saint Louis (www.sweetgum.nybg.org.2013) All specimens were stored at the Tatras National Park Museum in Tatranská Lomnica, Slovakia.

Results

Distribution in Slovakia, published data (Fig. 1)

Belianske Tatry, Košiare, 2011m a.s.l. (Šmarda 1948); Hornádska Basin, Sivá brada, travertine, 506m a.s.l. (Šmarda 1948); Nízke Tatry, between Ďumbier and Králový stol, 1600m a.s.l. (Šmarda 1948); Veľká Fatra, Blatnická and Gaderská Valley, *Caricetum davallianae* (Cvachová et al. 1980); Turčianska Basin, Kláštorské meadows around Turiec, *Caricetum davallianae* (Škovirová 1971); Vysoké Tatry, Malá Studená Valley, around 2000m a.s.l. Table 2. Results of chemical and physical analysis of groundwater from habitats of *Fissidens osmundoides*.

Sampling site: Liptovská Basin, fen meadow on left bank of Belanský Brook, *Caricetum davallianae*, 29 July 1998 (relevé No. 1, Table 1).

Discussion

In the alpine level, the moss occurs in the moist, humic rocks crevices and on the humic soil, both on limestone and granite substrata, but prefers the silicate substratum. Rarer occurs in the fen communities, where endures a higher content of bivalent basic cations (Table 2). We have recorded species in the communities of the alliance *Caricion davallianae*, the presence of relic species like *Paludella squarrosa*, *Breidleria pratensis* and *Tomentypnum nitens* suggest relic habitat. The trend of higher concentration of chlorides is common for *Fissidens osmundoides*, but high concentrations of potassium are not the limiting factor. Janišová (ined., pers. cont.) collected *Fissidens osmundoides* on the site Bulíková, land register Tajov (Starohorské vrchy Hills) in the community of the alliance

Caricion davallianae, the species like *Campylium stellatum*, *Cratoneuron filicinum*, *Bryum pseudotriquetrum* and *Palustriella commutata* were recorded as accompanying species.

In the high-altitudinal level the species occurs more often, always in humic habitats. We have recorded the species in the communities of the alliances *Juncion trifidi* (as. *Festuco supinae-Racomitrietum lanuginosi*), *Loiseleurio-Vaccinion* (as. *Salicetum kitaibellianae*), *Trisetetum fuscum* (as. *Trisetetum fuscum*), *Salicion herbaceae* (as. *Sedo alpestre-Salicetum herbaceae*) and in the alliance *Androsation alpiniae* (as. *Oxyrio digynae-Saxifragetum carpaticae*). Krajina (1933) recorded species in the as. *Trisetetum fuscum*.

In the middle boreal zone of Norway with oceanic climate the species more often enters the forest bogs (Frisvoll 1997).

Threat

The species has been recorded in the following habitats (Table 3):

Code	Catalogue of habitats of Slovakia	Natura 2000	Emerald	CORINE	EUNIS
Ra6	Alkaline fens	7230	54.2	54.2	D41
A11	Siliceous alpine and boreal grasslands	6150	-	36.34	E4.34

Table 3. The habitats of the species occurrence

The habitat of *Fissidens osmundoides* is placed in the list of Habitats of European Interest (Annex Nr. 1, Act No. 24/2003). In some published sites we could not confirm the species, despite intensive searching, e.g. Zelené pleso kežmarské (Šmarda 1952).

Test by revised IUCN threat categories:

A. Large decline

Very small decline observed, < than 20% in the last 10 years. Not applicable.

B. Restricted area of occupancy, few localities. Not applicable. Recorded recently in 53 sites in 12 10x10km squares

C. Small population and decline.

Not applicable. No detailed information available on population size.

D. Very small or restricted populations.

Not applicable. No detailed information available on population size.

Conclusion

At a regional level the new criteria have been tested in Slovakia (Kubinská et al. 2001), *Fissidens osmundoides* was considered as LR:nt (Lower Risk, Near Threatened). This species, which occurs in moist rock crevices in the alpine level and in fen communities, does not qualify for the Slovakian Red List. However, it may become Vulnerable in the near future unless adequate protection of wetlands is secured, so the status "near threatened" LR(nt) is confirmed.
